

Short note

An aberrant colour form of *Leucospis gigas* (FABRICIUS, 1793) (Hymenoptera: Chalcidoidea: Leucospidae) from Turkey

Michael MADL & Ernst KLIMSA

Leucospis gigas (FABRICIUS, 1793) is widely distributed in the warmer parts of the Palaearctic region. It is known from the following countries: Afghanistan, Albania, Algeria, Armenia, Austria, Bosnia and Hercegovina, China, Croatia (mainland, Hvar, Krk, Rab, Susak), Egypt, France (mainland, Corsica), Germany, Gibraltar, Greece (mainland, Chios, Corfu, Crete, Kalymnos), Hungary, Iran, Israel, Italy (mainland, Sardinia, Sicily), Jordan, Kyrgyzstan, Lebanon, Lybia, Macedonia, Malta, Montenegro, Morocco, Pakistan, Romania, Russia, Slovakia, Slovenia, Spain (mainland, Balears), Switzerland, Syria, Tajikistan, Tunesia, Turkey, Turkmenia, Ukraine, and Uzbekistan (BOUČEK 1974, YILDIRIM & al. 2002; Madl, unpublished).

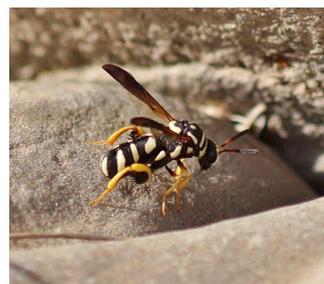

Fig. 1: Female of *Leucospis gigas* with aberrant colour (Photo: E. Klimsa).

Leucospis gigas occurs in yellow-marked or orange-marked colour forms, but also intermediate forms are known. For example, M. Madl found such an intermediate form (black and orange mesosoma and black and yellow metasoma) in the collection of the Natural History Museum in Vienna (Egypt, Cairo, leg. O. Schmiedeknecht, 1 ♀). The reasons for the colour forms are unknown.

In Turkey (Province Antalya: Göynük, near Kemer-Beldibi, about 35 km south from Antalya, 25.V.2013) E. Klimsa made a photo of *Leucospis gigas* in desiccating parts of a river. The female has a black and ebony-white body colour, but the antennae have the species-specific red markings and the legs are yellow-marked (see Fig. 1).
